Question 1

Correct

Marked out of 5.00

Write a function that takes an input String (sentence) and generates a new String (modified sentence) by reversing the words in the original String, maintaining the words position.

In addition, the function should be able to control the reversing of the case (upper or lowercase) based on a case_option parameter, as follows:

If case_option = 0, normal reversal of words i.e., if the original sentence is "Wipro TechNologies BangaLore", the new reversed sentence should be "orpiW seigolonhceT erolagnaB".

If case_option = 1, reversal of words with retaining position's case i.e., if the original sentence is "Wipro TechNologies BangaLore", the new reversed sentence should be "Orpiw SeigOlonhceT ErolaGnab".

Note that positions 1, 7, 11, 20 and 25 in the original string are uppercase W, T, N, B and L.

Similarly, positions 1, 7, 11, 20 and 25 in the new string are uppercase O, S, O, E and G.

NOTE:

1. Only space character should be treated as the word separator i.e., "Hello World" should be treated as two separate words, "Hello" and "World". However, "Hello,World", "Hello;World", "Hello-World" or "Hello/World" should be considered as a single word.
2. Non-alphabetic characters in the String should not be subjected to case changes. For example, if case option = 1 and the original sentence is "Wipro TechNologies, Bangalore" the new reversed sentence should be "Orpiw ,seigolonhceT Erolagnab". Note that comma has been treated as part of the word "Technologies," and when comma had to take the position of uppercase T it remained as a comma and uppercase T took the position of comma. However, the words "Wipro and Bangalore" have changed to "Orpiw" and "Erolagnab".
3. Kindly ensure that no extra (additional) space characters are embedded within the resultant reversed String.

Examples:

S. No.	input1	input2	output
1	Wipro Technologies Bangalore	0	orpiW seigolonhceT erolagnaB
2	Wipro Technologies, Bangalore	0	orpiW ,seigolonhceT erolagnaB
3	Wipro Technologies Bangalore	1	Orpiw SeigolonhceT Erolagnab
4	Wipro Technologies, Bangalore	1	Orpiw ,seigolonhceT Erolagnab

For example:

Input	Result
Wipro Technologies Bangalore 0	orpiW seigolonhceT erolagnaB
Wipro Technologies, Bangalore 0	orpiW ,seigolonhceT erolagnaB
Wipro Technologies Bangalore 1	Orpiw SeigolonhceT Erolagnab
Wipro Technologies, Bangalore 1	Orpiw ,seigolonhceT Erolagnab

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2
3 public class WordReverser {
4     public static String reverseWordsWithCase(String sentence, int caseOption) {
5         // Split the sentence into words based on spaces

Passed all tests! ✓

Question **2**

Correct

Marked out of 5.00

You are provided with a string which has a sequence of 1's and 0's.

This sequence is the encoded version of a English word. You are supposed write a program to decode the provided string and find the original word.

Each alphabet is represented by a sequence of 0s.

This is as mentioned below:

Z : 0

Y : 00

X : 000

W : 0000

V : 00000

U : 000000

T : 0000000

and so on upto A having 26 0's (000000000000000000000000000000).

The sequence of 0's in the encoded form are separated by a single 1 which helps to distinguish between 2 letters.

Example 1:

input1: 010010001

The decoded string (original word) will be: ZYX

Example 2:

input1: 00001000000000000000000001000000000001000000000100000000000001

The decoded string (original word) will be: WIPRO

Note: The decoded string must always be in UPPER case.

For example:

Input	Result
010010001	ZYX
00001000000000000000000001000000000001000000000100000000000001	WIPRO

Answer: (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class DecodeString {
3     public static void main(String[] args) {
4         Scanner scanner = new Scanner(System.in);
5         String encodedString = scanner.nextLine();
6         StringBuilder decodedString = new StringBuilder();
7         int count = 0;
8         for (int i = 0; i < encodedString.length(); i++) {
9             if (encodedString.charAt(i) == '0') { count++;
10          } else {
11             char decodedChar = (char) ('Z' - count + 1);
12             decodedString.append(decodedChar);
13             count = 0;
14         }
15     }
16     System.out.println(decodedString.toString());
17 }
```

	Input	Expected	Got	
✓	010010001	ZYX	ZYX	✓
✓	00001000000000000000000000100000000000100000000010000000000001	WIPRO	WIPRO	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 5.00

Given two char arrays input1[] and input2[] containing only lower case alphabets, extracts the alphabets which are present in both arrays (common alphabets).

Get the ASCII values of all the extracted alphabets.

Calculate sum of those ASCII values. Lets call it sum1 and calculate single digit sum of sum1, i.e., keep adding the digits of sum1 until you arrive at a single digit.

Return that single digit as output.

Note:

1. Array size ranges from 1 to 10.
2. All the array elements are lower case alphabets.
3. Atleast one common alphabet will be found in the arrays.

Example 1:

input1: {'a', 'b', 'c'}

input2: {'b', 'c'}

output: 8

Explanation:

'b' and 'c' are present in both the arrays.

ASCII value of 'b' is 98 and 'c' is 99.

$98 + 99 = 197$

$1 + 9 + 7 = 17$

$1 + 7 = 8$

For example:

Input	Result
a b c b c	8

Answer: (penalty regime: 0 %)

```
1 import java.util.HashSet; import java.util.Set; public class CommonAlphabetSum {
2 public static int singleDigitSum(int num) { int sum = 0;
3 while (num > 0) {
4 sum += num % 10;
5 num /= 10;
6 }
7 if (sum > 9) { return singleDigitSum(sum); }
8 return sum;
9 }
10 public static int calculateCommonAlphabetSum(char[] input1, char[] input2) { Set<Character> set1 = new HashSet<>()
11 }
12 int sum = 0; for (char c : input2) {
13 if (set1.contains(c)) { sum += c;
14 }
15 }
16 return singleDigitSum(sum);
17 }
18 public static void main(String[] args) { char[] input1 = {'a', 'b', 'c'}; char[] input2 = {'b', 'c', 'd'};
19 int result = calculateCommonAlphabetSum(input1, input2); System.out.println(result); }
20 }
```

	Input	Expected	Got	
✓	a b c b c	8	8	✓

Passed all tests! ✓

Question **1**

Correct

Marked out of 1.00

Java HashSet class implements the Set interface, backed by a hash table which is actually a [HashMap](#) instance.

No guarantee is made as to the iteration order of the hash sets which means that the class does not guarantee the constant order of elements over time.

This class permits the null element.

The class also offers constant time performance for the basic operations like add, remove, contains, and size assuming the hash function disperses the elements properly among the buckets.

Java HashSet Features

A few important features of HashSet are mentioned below:

- Implements [Set Interface](#).
- The underlying data structure for HashSet is [Hashtable](#).
- As it implements the Set Interface, duplicate values are not allowed.
- Objects that you insert in HashSet are not guaranteed to be inserted in the same order. Objects are inserted based on their hash code.
- NULL elements are allowed in HashSet.
- HashSet also implements **Serializable** and **Cloneable** interfaces.

```
public class HashSet<E> extends AbstractSet<E> implements Set<E>, Cloneable, Serializable
```

Sample Input and Output:

```
5
90
56
45
78
25
78
```

Sample Output:

78 was found in the set.

Sample Input and output:

```
3
2
7
9
5
```

Sample Input and output:

5 was not found in the set.

Answer: (penalty regime: 0 %)

Reset answer

```
1 import java.util.HashSet;
2 import java.util.Scanner;
3
4 public class Prog {
5     public static void main(String[] args) {
6         Scanner sc = new Scanner(System.in);
7
8
9         int n = sc.nextInt();
10        HashSet<Integer> numbers = new HashSet<>();
11
12        for (int i = 0; i < n; i++) {
13            numbers.add(sc.nextInt());
14        }
15
16        int skey = sc.nextInt();
17
18        if (numbers.contains(skey)) {
19            System.out.println(skey + " was found in the set.");
20        } else {
21            System.out.println(skey + " was not found in the set.");
22        }
23
24        sc.close();
25    }
26 }
27
```

Question 1

Correct

Marked out of 1.00

Given an ArrayList, the task is to get the first and last element of the ArrayList in Java.

Input: ArrayList = [1, 2, 3, 4]

Output: First = 1, Last = 4

Input: ArrayList = [12, 23, 34, 45, 57, 67, 89]

Output: First = 12, Last = 89

Approach:

1. Get the ArrayList with elements.
2. Get the first element of ArrayList using the get(index) method by passing index = 0.
3. Get the last element of ArrayList using the get(index) method by passing index = size – 1.

Answer: (penalty regime: 0 %)

```

1 import java.util.ArrayList;
2 import java.util.Scanner;
3
4 public class Main {
5     public static void main(String[] args) {
6         Scanner scanner = new Scanner(System.in);
7         ArrayList<Integer> arrayList = new ArrayList<>();
8
9         int n = scanner.nextInt(); // Read the size of the ArrayList
10
11
12         for (int i = 0; i < n; i++) {
13             arrayList.add(scanner.nextInt()); // Add each element to the ArrayList
14         }
15         System.out.println("ArrayList: " + arrayList);
16         if (!arrayList.isEmpty()) {
17             int first = arrayList.get(0); // First element
18             int last = arrayList.get(arrayList.size() - 1); // Last element
19
20             System.out.println("First : " + first + ", Last : " + last);
21         } else {
22             System.out.println("The ArrayList is empty.");
23         }
24         scanner.close();
25     }
26 }
27

```

	Test	Input	Expected	Got	
✓	1	6 30 20 40 50 10 80	ArrayList: [30, 20, 40, 50, 10, 80] First : 30, Last : 80	ArrayList: [30, 20, 40, 50, 10, 80] First : 30, Last : 80	✓
✓	2	4 5 15 25 35	ArrayList: [5, 15, 25, 35] First : 5, Last : 35	ArrayList: [5, 15, 25, 35] First : 5, Last : 35	✓

Passed all tests! ✓

Question **2**

Correct

Marked out of 1.00

The given Java program is based on the ArrayList methods and its usage. The Java program is partially filled. Your task is to fill in the incomplete statements to get the desired output.

list.set();

list.indexOf();

list.lastIndexOf()

list.contains()

list.size();

list.add();

list.remove();

The above methods are used for the below Java program.

Answer: (penalty regime: 0 %)

Reset answer

```

1 import java.util.ArrayList; import java.util.Scanner;
2 public class Prog {
3     public static void main(String[] args) {
4         Scanner sc= new Scanner(System.in); int n = sc.nextInt();
5         ArrayList<Integer> list = new ArrayList<Integer>();
6         for(int i = 0; i<n;i++) list.add(sc.nextInt());
7         // printing initial value ArrayList
8         System.out.println("ArrayList: " + list);
9         //Replacing the element at index 1 with 100
10        list.set(1,100);
11        //Getting the index of first occurrence of 100
12        System.out.println("Index of 100 = " + list.indexOf(100) );
13        //Getting the index of last occurrence of 100
14        System.out.println("LastIndex of 100 = " + list.lastIndexOf(100));
15        // Check whether 200 is in the list or not
16        System.out.println(list.contains(200)); //Output : false
17        // Print ArrayList size
18        System.out.println("Size Of ArrayList = "+list.size() );
19        //Inserting 500 at index 1
20        list.add(1,500); // code here
21        //Removing an element from position 3
22        list.remove(3); // code here
23        System.out.print("ArrayList: " + list); }
24    }

```

	Test	Input	Expected	Got	
✓	1	5 1 2 3 100 5	ArrayList: [1, 2, 3, 100, 5] Index of 100 = 1 LastIndex of 100 = 3 false Size Of ArrayList = 5 ArrayList: [1, 500, 100, 100, 5]	ArrayList: [1, 2, 3, 100, 5] Index of 100 = 1 LastIndex of 100 = 3 false Size Of ArrayList = 5 ArrayList: [1, 500, 100, 100, 5]	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 1.00

Write a Java program to reverse elements in an array list.

Sample input and Output:

Red

Green

Orange

White

Black

Sample output

List before reversing :

[Red, Green, Orange, White, Black]

List after reversing :

[Black, White, Orange, Green, Red]

Answer: (penalty regime: 0 %)

```

1 import java.util.ArrayList;
2 import java.util.Collections;
3 import java.util.Scanner;
4 public class ReverseArrayList {
5     public static void main(String[] args) {
6         Scanner scanner = new Scanner(System.in);
7         ArrayList<String> list = new ArrayList<>();
8         int n = scanner.nextInt();
9         for (int i = 0; i < n; i++) {
10             String element = scanner.next();
11             list.add(element);
12         }
13         System.out.println("List before reversing : ");
14         System.out.println(list);
15         Collections.reverse(list);
16         System.out.println("List after reversing : ");
17         System.out.println(list);
18     }
19 }

```

	Test	Input	Expected	Got	
✓	1	5 Red Green Orange White Black	List before reversing : [Red, Green, Orange, White, Black] List after reversing : [Black, White, Orange, Green, Red]	List before reversing : [Red, Green, Orange, White, Black] List after reversing : [Black, White, Orange, Green, Red]	✓
✓	2	4 CSE AIML AIDS CYBER	List before reversing : [CSE, AIML, AIDS, CYBER] List after reversing : [CYBER, AIDS, AIML, CSE]	List before reversing : [CSE, AIML, AIDS, CYBER] List after reversing : [CYBER, AIDS, AIML, CSE]	✓

Question 1

Correct

Marked out of 5.00

As a logic building learner you are given the task to extract the string which has vowel as the first and last characters from the given array of Strings.

Step1: Scan through the array of Strings, extract the Strings with first and last characters as vowels; these strings should be concatenated.

Step2: Convert the concatenated string to lowercase and return it.

If none of the strings in the array has first and last character as vowel, then return no matches found

input1: an integer representing the number of elements in the array.

input2: String array.

Example 1:

input1: 3

input2: {"oreo", "sirish", "apple"}

output: oreoapple

Example 2:

input1: 2

input2: {"Mango", "banana"}

output: no matches found

Explanation:

None of the strings has first and last character as vowel.

Hence the output is no matches found.

Example 3:

input1: 3

input2: {"Ate", "Ace", "Girl"}

output: ateace

For example:

Input	Result
3 oreo sirish apple	oreoapple
2 Mango banana	no matches found
3 Ate Ace Girl	ateace

Answer: (penalty regime: 0 %)

```

1 import java.util.*;
2 class prog{
3     public static void main(String arh[]){
4         Scanner sc= new Scanner(System.in);
5         int n = sc.nextInt();
6         String arr[]= new String[n];
7         sc.nextLine();
8         String str= sc.nextLine();
9         String temp="";
10        int j=0;
11        int l=str.length();
12        for(int i=0;i<l;i++){
13            if(str.charAt(i)==' '){
14                arr[j]=temp;
15                temp="";
16                j++;
17            }
18            else{
19                temp+=str.charAt(i);

```

```

19         temp = getCharacter(2);
20     }
21 }
22 arr[j]=temp;
23 String s="";
24 char []cha={'a','A','e','E','i','I','o','O','u','U'};
25 for(int i=0;i<n;i++){
26     int c=0;
27     char [] ar = arr[i].toCharArray();
28     char ch1=ar[0];
29     char ch2 = ar[ar.length-1];
30     for(char k: cha){
31         if(k==ch1){
32             c++;
33         }
34         if(k==ch2){
35             c++;//s+=arr[i];
36         }
37     }
38     if(c==2){
39         s+=arr[i];
40     }
41 }
42 if(s==""){
43     System.out.print("no matches found");
44 }
45 }
46 else{
47     System.out.print(s.toLowerCase());
48 }
49 }
50 }

```

Question **2**

Correct

Marked out of 5.00

1. Final Variable:

- Once a variable is declared **final**, its value cannot be changed after it is initialized.
- It must be initialized when it is declared or in the constructor if it's not initialized at declaration.
- It can be used to define constants

```
final int MAX_SPEED = 120; // Constant value, cannot be changed
```

2. Final Method:

- A method declared **final** cannot be overridden by subclasses.
- It is used to prevent modification of the method's behavior in derived classes.

```
public final void display() {  
    System.out.println("This is a final method.");  
}
```

3. Final Class:

- A class declared as **final** cannot be subclassed (i.e., no other class can inherit from it).
- It is used to prevent a class from being extended and modified.
- ```
public final class Vehicle {
 // class code
}
```

**Given a Java Program that contains the bug in it, your task is to clear the bug to the output.**

**you should delete any piece of code.**

**For example:**

| Test | Result                                                                |
|------|-----------------------------------------------------------------------|
| 1    | The maximum speed is: 120 km/h<br>This is a subclass of FinalExample. |

**Answer:** (penalty regime: 0 %)

Reset answer

```
1 class FinalExample {
2
3 // Final variable
4 final int maxSpeed = 120;
5
6 // Final method
7 public void displayMaxSpeed() {
8 System.out.println("The maximum speed is: " + maxSpeed + " km/h");
9 }
10 }
11
12 class SubClass extends FinalExample {
13 // @Override
14 public void displayMaxSpeed() {
15 System.out.println("Cannot override a final method");
16 }
17
18 // You can create new methods here
19 public void showDetails() {
20 System.out.println("This is a subclass of FinalExample.");
21 }
22 }
23
24 class prog {
25 public static void main(String[] args) {
26 FinalExample obj = new FinalExample();
27 obj.displayMaxSpeed();
28
29 SubClass subObj = new SubClass();
30 subObj.showDetails();
31 }
32 }
```

|   | Test | Expected                                                              | Got                                                                   |   |
|---|------|-----------------------------------------------------------------------|-----------------------------------------------------------------------|---|
| ✓ | 1    | The maximum speed is: 120 km/h<br>This is a subclass of FinalExample. | The maximum speed is: 120 km/h<br>This is a subclass of FinalExample. | ✓ |

## Question 3

Correct

Marked out of 5.00

Create a base class Shape with a method called calculateArea(). Create three subclasses: Circle, Rectangle, and Triangle. Override the calculateArea() method in each subclass to calculate and return the shape's area.

In the given exercise, here is a simple diagram illustrating polymorphism implementation:

```

abstract class Shape {
 public abstract double calculateArea() ;
}

```

```
System.out.printf("Area of a Triangle :%.2f\n",((0.5)*base*height)); // use this statement
```

sample Input :

```

4 // radius of the circle to calculate area PI*r*r
5 // length of the rectangle
6 // breadth of the rectangle to calculate the area of a rectangle
4 // base of the triangle
3 // height of the triangle

```

**OUTPUT:**

**Area of a circle :50.27**

**Area of a Rectangle :30.00**

**Area of a Triangle :6.00**

**For example:**

| Test | Input                         | Result                                                                             |
|------|-------------------------------|------------------------------------------------------------------------------------|
| 1    | 4<br>5<br>6<br>4<br>3         | Area of a circle: 50.27<br>Area of a Rectangle: 30.00<br>Area of a Triangle: 6.00  |
| 2    | 7<br>4.5<br>6.5<br>2.4<br>3.6 | Area of a circle: 153.94<br>Area of a Rectangle: 29.25<br>Area of a Triangle: 4.32 |

**Answer:** (penalty regime: 0 %)

```

1 import java.util.*;
2 abstract class Shape{
3 abstract void calculatearea();
4 }
5 class Circle extends Shape{
6 float rad;
7 Circle(float rad){
8 this.rad=rad;
9 }

## Question 1

Correct

Marked out of 5.00

Create interfaces shown below.

```
interface Sports {
 public void setHomeTeam(String name);
 public void setVisitingTeam(String name);
}
```

```
interface Football extends Sports {
 public void homeTeamScored(int points);
 public void visitingTeamScored(int points);
}
```

create a class College that implements the Football interface and provides the necessary functionality to the abstract methods.

sample Input:

```
Rajalakshmi
Saveetha
22
21
```

Output:

```
Rajalakshmi 22 scored
Saveetha 21 scored
Rajalakshmi is the Winner!
```

**For example:**

| Test | Input                               | Result                                                                    |
|------|-------------------------------------|---------------------------------------------------------------------------|
| 1    | Rajalakshmi<br>Saveetha<br>22<br>21 | Rajalakshmi 22 scored<br>Saveetha 21 scored<br>Rajalakshmi is the winner! |

**Answer:** (penalty regime: 0 %)

Reset answer

```
1 import java.util.Scanner;
2 interface Sports {
3 void setHomeTeam(String name);
4 void setVisitingTeam(String name);
5 }

## Question 2

Correct

Marked out of 5.00

RBI issues all national banks to collect interest on all customer loans.

Create an RBI interface with a variable `String parentBank="RBI"` and abstract method `rateOfInterest()`.

RBI interface has two more methods default and static method.

default void `policyNote()` {

`System.out.println("RBI has a new Policy issued in 2023.");`

}

static void `regulations()`{

`System.out.println("RBI has updated new regulations on 2024.");`

}

Create two subclasses SBI and Karur which implements the RBI interface.

Provide the necessary code for the abstract method in two sub-classes.

**Sample Input/Output:**

**RBI has a new Policy issued in 2023**

**RBI has updated new regulations in 2024.**

**SBI rate of interest: 7.6 per annum.**

**Karur rate of interest: 7.4 per annum.**

For example:

| Test | Result                                                                                                                                                            |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | RBI has a new Policy issued in 2023<br>RBI has updated new regulations in 2024.<br>SBI rate of interest: 7.6 per annum.<br>Karur rate of interest: 7.4 per annum. |

**Answer:** (penalty regime: 0 %)

```
1 interface RBI {
2 String parentBank = "RBI";
3 double rateOfIntrest();
4 default void policyNote() {
5 System.out.println("RBI has a new Policy issued in 2023");
6 }
7
8 static void regulations() {
9 System.out.println("RBI has updated new regulations in 2024.");
10 }
11 }
12 class SBI implements RBI {
13 public double rateOfIntrest(){
14 return 7.6;
15 }
16 }
17 class Karur implements RBI{
18 public double rateOfIntrest(){
19 return 7.4;
20 }
21 }
22 public class Main {
23 public static void main(String[] args){
24 RBI rbi = new SBI();
25 rbi.policyNote();
26 RBI.regulations();
27 SBI sbi = new SBI();
28 System.out.println("SBI rate of interest: "+sbi.rateOfIntrest()+ " per annum.");
29 Karur karur = new Karur();
30 System.out.println("Karur rate of interest: "+karur.rateOfIntrest() + " per annum.");
31 }
32 }
33 }
```

Question **3**

Correct

Marked out of 5.00

create an interface Playable with a method play() that takes no arguments and returns void. Create three classes Football, Volleyball, and Basketball that implement the Playable interface and override the play() method to play the respective sports.

```
interface Playable {
 void play();
}

class Football implements Playable {
 String name;
 public Football(String name){
 this.name=name;
 }
 public void play() {
 System.out.println(name+" is Playing football");
 }
}
```

Similarly, create Volleyball and Basketball classes.

**Sample output:**

```
Sadhvin is Playing football
Sanjay is Playing volleyball
Sruthi is Playing basketball
```

**For example:**

| Test | Input                       | Result                                                                                      |
|------|-----------------------------|---------------------------------------------------------------------------------------------|
| 1    | Sadhvin<br>Sanjay<br>Sruthi | Sadhvin is Playing football<br>Sanjay is Playing volleyball<br>Sruthi is Playing basketball |
| 2    | Vijay<br>Arun<br>Balaji     | Vijay is Playing football<br>Arun is Playing volleyball<br>Balaji is Playing basketball     |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 interface Playable {
3 void play();
4 }
5
6 class Football implements Playable {
7 String name;
8 public Football(String name) {
9 this.name = name;

## Question 1

Correct

Marked out of 5.00

Given 2 strings input1 & input2.

- Concatenate both the strings.
- Remove duplicate alphabets & white spaces.
- Arrange the alphabets in descending order.

Assumption 1:

There will either be alphabets, white spaces or null in both the inputs.

Assumption 2:

Both inputs will be in lower case.

Example 1:

Input 1: apple

Input 2: orange

Output: rponlgea

Example 2:

Input 1: fruits

Input 2: are good

Output: utsroigfeda

Example 3:

Input 1: ""

Input 2: ""

Output: null

**For example:**

| Test | Input              | Result      |
|------|--------------------|-------------|
| 1    | apple<br>orange    | rponlgea    |
| 2    | fruits<br>are good | utsroigfeda |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.*;
2 public class StringMergeSort {
3 public static String mergeAndSort(String input1, String input2){
4 String concatenated = input1 + input2;
5 Set<Character> uniqueChars = new HashSet<>();
6 for (char ch : concatenated.toCharArray()) {
7 if (ch != ' ') {
8 uniqueChars.add(ch);
9 }
10 }
11 List<Character> sortedList = new ArrayList<>(uniqueChars);
12 Collections.sort(sortedList, Collections.reverseOrder());
13 StringBuilder result = new StringBuilder();
14 for (char ch : sortedList) {
15 result.append(ch);
16 }
17 return result.length() > 0 ? result.toString() : "null";
18 }
19 public static void main(String[] args) {
20 Scanner scanner = new Scanner(System.in);
21 String input1 = scanner.nextLine();
22 String input2 = scanner.nextLine();
23 String result = mergeAndSort(input1, input2);
24 System.out.println(result);
25 }
26 }
27 }
```

|   | Test | Input              | Expected    | Got         |   |
|---|------|--------------------|-------------|-------------|---|
| ✓ | 1    | apple<br>orange    | rponlgea    | rponlgea    | ✓ |
| ✓ | 2    | fruits<br>are good | utsroigfeda | utsroigfeda | ✓ |
| ✓ | 3    |                    | null        | null        | ✓ |

Passed all tests! ✓

Question **2**

Correct

Marked out of 5.00

Given a String input1, which contains many number of words separated by : and each word contains exactly two lower case alphabets, generate an output based upon the below 2 cases.

Note:

1. All the characters in input 1 are lowercase alphabets.
2. input 1 will always contain more than one word separated by :
3. Output should be returned in uppercase.

Case 1:

Check whether the two alphabets are same.

If yes, then take one alphabet from it and add it to the output.

Example 1:

input1 = ww:ii:pp:rr:oo

output = WIPRO

Explanation:

word1 is ww, both are same hence take w

word2 is ii, both are same hence take i

word3 is pp, both are same hence take p

word4 is rr, both are same hence take r

word5 is oo, both are same hence take o

Hence the output is WIPRO

Case 2:

If the two alphabets are not same, then find the position value of them and find maximum value – minimum value.

Take the alphabet which comes at this (maximum value - minimum value) position in the alphabet series.

Example 2"

input1 = zx:za:ee

output = BYE

Explanation

word1 is zx, both are not same alphabets

position value of z is 26

position value of x is 24

max – min will be  $26 - 24 = 2$

Alphabet which comes in 2<sup>nd</sup> position is b

Word2 is za, both are not same alphabets

position value of z is 26

position value of a is 1

max – min will be  $26 - 1 = 25$

Alphabet which comes in 25<sup>th</sup> position is y

word3 is ee, both are same hence take e

Hence the output is BYE

**For example:**

| Input          | Result |
|----------------|--------|
| ww:ii:pp:rr:oo | WIPRO  |
| zx:za:ee       | BYE    |

Answer: (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class StringManipulation {
3 public static char findChar(char ch1, char ch2) {
4 if (ch1 == ch2){
5 return ch1;
6 }
7 else{
8 int max= Math.max(ch1 - 'a' + 1,ch2 - 'a'+ 1);
9 int min= Math.min(ch1 - 'a' + 1,ch2 - 'a'+ 1);
10 int pos = max - min;
11 return (char) ('a'+ pos -1);
12 }
13 }
14 public static String processString(String input){
15 String[] pairs = input.split(":");
16 StringBuilder result = new StringBuilder();
17 for (String pair : pairs){
18 char ch1 = pair.charAt(0);
19 char ch2 = pair.charAt(1);
20 result.append(findChar(ch1, ch2));
21 }
22 return result.toString().toUpperCase();
23 }
24 public static void main(String[] args){
25 Scanner scanner = new Scanner(System.in);
26 String input=scanner.nextLine();
27 String result= processString(input);
28 System.out.println(result);
29 scanner.close();
30 }
31 }
```

|   | Input          | Expected | Got   |   |
|---|----------------|----------|-------|---|
| ✓ | ww:ii:pp:rr:oo | WIPRO    | WIPRO | ✓ |
| ✓ | zx:za:ee       | BYE      | BYE   | ✓ |

Passed all tests! ✓

## Question 3

Correct

Marked out of 5.00

You are provided a string of words and a 2-digit number. The two digits of the number represent the two words that are to be processed.

For example:

If the string is "Today is a Nice Day" and the 2-digit number is 41, then you are expected to process the 4th word ("Nice") and the 1st word ("Today").

The processing of each word is to be done as follows:

Extract the Middle-to-Begin part: Starting from the middle of the word, extract the characters till the beginning of the word.

Extract the Middle-to-End part: Starting from the middle of the word, extract the characters till the end of the word.

If the word to be processed is "Nice":

Its Middle-to-Begin part will be "iN".

Its Middle-to-End part will be "ce".

So, merged together these two parts would form "iNce".

Similarly, if the word to be processed is "Today":

Its Middle-to-Begin part will be "doT".

Its Middle-to-End part will be "day".

So, merged together these two parts would form "doTday".

Note: Note that the middle letter 'd' is part of both the extracted parts. So, for words whose length is odd, the middle letter should be included in both the extracted parts.

Expected output:

The expected output is a string containing both the processed words separated by a space "iNce doTday"

Example 1:

input1 = "Today is a Nice Day"

input2 = 41

output = "iNce doTday"

Example 2:

input1 = "Fruits like Mango and Apple are common but Grapes are rare"

input2 = 39

output = "naMngo arGpes"

Note: The input string input1 will contain only alphabets and a single space character separating each word in the string.

Note: The input string input1 will NOT contain any other special characters.

Note: The input number input2 will always be a 2-digit number ( $\geq 11$  and  $\leq 99$ ). One of its digits will never be 0. Both the digits of the number will always point to a valid word in the input1 string.

**For example:**

| Input                                                            | Result        |
|------------------------------------------------------------------|---------------|
| Today is a Nice Day<br>41                                        | iNce doTday   |
| Fruits like Mango and Apple are common but Grapes are rare<br>39 | naMngo arGpes |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class WordProcessor {
3 public static void main(String[] args) {
4 Scanner sc = new Scanner(System.in);
5 String input = sc.nextLine();
6 int number = sc.nextInt();
7 String[] words = input.split(" ");
8 int pos1 = number / 10;
9 int pos2 = number % 10;
10 nos1--;
```

```

11 pos2--;
12 String result1 = processWord(words[pos1]);
13 String result2 = processWord(words[pos2]);
14 String result = result1+" "+result2;
15 System.out.println(result);
16 }
17 private static String processWord(String word) {
18 int len = word.length();
19 int mid = len / 2;
20 String middleToBegin;
21 String middleToEnd;
22 if (len % 2 == 0){
23 middleToBegin = new StringBuilder(word.substring(0, mid)).reverse().toString();
24 middleToEnd = word.substring(mid);
25 }else{
26 middleToBegin = new StringBuilder(word.substring(0,mid+1)).reverse().toString();
27 middleToEnd = word.substring(mid);
28 }
29 return middleToBegin + middleToEnd;
30 }
31 }

```

|   | Input                                                            | Expected      | Got           |   |

## Question 1

Correct

Marked out of 5.00

create a class called College with attribute String name, constructor to initialize the name attribute , a method called Admitted(). Create a subclass called CSE that extends Student class, with department attribute , Course() method to sub class. Print the details of the Student.

College:

```
String collegeName;
```

```
public College() {}
```

```
public admitted() {}
```

Student:

```
String studentName;
```

```
String department;
```

```
public Student(String collegeName, String studentName,String depart) {}
```

```
public toString()
```

Expected Output:

A student admitted in REC

CollegeName : REC

StudentName : Venkatesh

Department : CSE

**For example:**

**Result**

A student admitted in REC

CollegeName : REC

StudentName : Venkatesh

Department : CSE

**Answer:** (penalty regime: 0 %)

Reset answer

```
1 class College
2 {

## Question 3

Correct

Marked out of 5.00

Create a class known as "BankAccount" with methods called deposit() and withdraw().

Create a subclass called SavingsAccount that overrides the withdraw() method to prevent withdrawals if the account balance falls below one hundred.

For example:

**Result**

```
Create a Bank Account object (A/c No. BA1234) with initial balance of $500:
Deposit $1000 into account BA1234:
New balance after depositing $1000: $1500.0
Withdraw $600 from account BA1234:
New balance after withdrawing $600: $900.0
Create a SavingsAccount object (A/c No. SA1000) with initial balance of $300:
Try to withdraw $250 from SA1000!
Minimum balance of $100 required!
Balance after trying to withdraw $250: $300.0
```

Answer: (penalty regime: 0 %)

Reset answer

```
1 class BankAccount {
2 // Private field to store the account number
3 private String accountNumber;
4
5 // Private field to store the balance
6 private double balance;
7 public BankAccount(String accountNumber, double balance){
8 this.accountNumber=accountNumber;
9 this.balance=balance;
10 }
11
12 // Constructor to initialize account number and balance
13
14
15
16
17
18 // Method to deposit an amount into the account
19 public void deposit(double amount) {
20 balance+=amount;
21 // Increase the balance by the deposit amount
22 }
23
24
25 // Method to withdraw an amount from the account
26 public void withdraw(double amount) {
27 // Check if the balance is sufficient for the withdrawal
28 if (balance >= amount) {
29 // Decrease the balance by the withdrawal amount
30 balance -= amount;
31 } else {
32 // Print a message if the balance is insufficient
33 System.out.println("Insufficient balance");
34 }
35 }
36
37 // Method to get the current balance
38 public double getBalance() {
39 return balance;
40 // Return the current balance
41 }
42 }
43
44
45 class SavingsAccount extends BankAccount {
46 // Constructor to initialize account number and balance
47 public SavingsAccount(String accountNumber, double balance) {
48 super(accountNumber, balance);
49 // Call the parent class constructor
50 }
```

|    |   |
|----|---|
| 51 | } |
| 52 |   |

|   | Expected                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Got                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |   |

## Question 1

Correct

Marked out of 5.00

Create a class called "Circle" with a radius attribute. You can access and modify this attribute using getter and setter methods. Calculate the area and circumference of the circle.

Area of Circle =  $\pi r^2$

Circumference =  $2\pi r$

Input:

2

Output:

Area = 12.57

Circumference = 12.57

For example:

| Test | Input | Result                                |
|------|-------|---------------------------------------|
| 1    | 4     | Area = 50.27<br>Circumference = 25.13 |

Answer: (penalty regime: 0 %)

Reset answer

```

1 import java.io.*;
2 import java.util.Scanner;
3 class Circle
4 {
5 private double radius;
6 public Circle(double radius){
7 this.radius=radius;
8 // set the instance variable radius
9
10
11 }
12 public void setRadius(double radius){
13 this.radius=radius;
14 // set the radius
15
16 }
17
18 public double getRadius() {
19 return radius;
20 // return the radius
21
22 }
23
24 public double calculateArea() {
25 return Math.PI*radius*radius;// complete the below statement
26
27 }
28
29 public double calculateCircumference() {
30 // complete the statement
31 return 2*Math.PI*radius;
32 }
33 }
34 class prog{
35 public static void main(String[] args) {
36 int r;
37 Scanner sc= new Scanner(System.in);
38 r=sc.nextInt();
39 Circle c= new Circle(r);
40 System.out.println("Area = "+String.format("%.2f", c.calculateArea()));
41 System.out.println("Circumference = "+String.format("%.2f",c.calculateCircumference()));
42 // invoke the calculatecircumference method
43
44
45 }
46 }
47

```

## Question 2

Correct

Marked out of 5.00

Create a class Student with two private attributes, name and roll number. Create three objects by invoking different constructors available in the class Student.

Student()

Student(String name)

Student(String name, int rollno)

**Input:**

No input

**Output:**

No-arg constructor is invoked

1 arg constructor is invoked

2 arg constructor is invoked

Name =null , Roll no = 0

Name =Rajalakshmi , Roll no = 0

Name =Lakshmi , Roll no = 101

For example:

| Test | Result                                                                                                                                                                                        |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1    | No-arg constructor is invoked<br>1 arg constructor is invoked<br>2 arg constructor is invoked<br>Name =null , Roll no = 0<br>Name =Rajalakshmi , Roll no = 0<br>Name =Lakshmi , Roll no = 101 |

**Answer:** (penalty regime: 0 %)

```
1 public class student{
2 private String name;
3 private int rollno;
4 public student(){
5 this.name=null;
6 this.rollno=0;
7 System.out.println("No-arg constructor is invoked");
8 }
9 public student(String name){
10 this.name=name;
11 this.rollno=0;
12 System.out.println("1 arg constructor is invoked");
13 }
14 public student(String name,int rollno){
15 this.name=name;
16 this.rollno=rollno;
17 System.out.println("2 arg constructor is invoked");
18 }
19 public void display(){
20 System.out.println("Name =" + name + " , Roll no = " + rollno);
21 }
22 }
23 public static void main(String[] args){
24 student stu1=new student();
25 student stu2=new student("Rajalakshmi");
26 student stu3=new student("Lakshmi", 101);
27 stu1.display();
28 stu2.display();
29 stu3.display();
30 }
31 }
```

|   | Test | Expected                                                                                                                                                                                      | Got                                                                                                                                                                                           |   |

## Question 3

Correct

Marked out of 5.00

Create a Class Mobile with the attributes listed below,

```
private String manufacturer;
private String operating_system;
public String color;
private int cost;
```

Define a Parameterized constructor to initialize the above instance variables.

Define getter and setter methods for the attributes above.

for example : setter method for manufacturer is

```
void setManufacturer(String manufacturer){
 this.manufacturer= manufacturer;
}
```

```
String getManufacturer(){
 return manufacturer;}

```

Display the object details by overriding the toString() method.

**For example:**

| Test | Result                                                                             |
|------|------------------------------------------------------------------------------------|
| 1    | manufacturer = Redmi<br>operating_system = Andriod<br>color = Blue<br>cost = 34000 |

**Answer:** (penalty regime: 0 %)

```
1 public class Mobile{
2 private String manufacturer;
3 private String operating_system;
4 public String color;
5 private int cost;
6 public Mobile(String manufacturer, String operating_system, String color,int cost){
7 this.manufacturer=manufacturer;
8 this.operating_system=operating_system;
9 this.color=color;
10 this.cost=cost;
11 }
12 public void setmanufacturer(String manufacturer){
13 this.manufacturer=manufacturer;
14 }
15 }
16 public String getManufacturer(){
17 return manufacturer;
18 }
19 public void setOperatingSystem(String operating_system){
20 this.operating_system=operating_system;
21 }
22 public String getOperatingSystem(){
23 return operating_system;
24 }
25 public void setColor(String color){
26 this.color=color;
27 }
28 public String getcolor(){
29 return color;
30 }
31 public void setcost(int cost){
32 this.cost=cost;
33 }
34 public int getCost(){
35 return cost;
36 }
37 public String toString(){
38 return "manufacturer = " + manufacturer + '\n' +"operating_system = "+ operating_system+ '\n' +"color = '
39 }
```

```
40 | public static void main(String[] args){
41 | Mobile mo=new Mobile("Redmi", "Andriod", "Blue", 34000);
42 | System.out.println(mo);
43 | }
44 | }
```

|   | Test | Expected                                                                           | Got                                                                                |   |
|---|------|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|---|
| ✓ | 1    | manufacturer = Redmi<br>operating_system = Andriod<br>color = Blue<br>cost = 34000 | manufacturer = Redmi<br>operating_system = Andriod<br>color = Blue<br>cost = 34000 | ✓ |

## Question 1

Correct

Marked out of 5.00

Given an integer array as input, perform the following operations on the array, in the below specified sequence.

1. Find the maximum number in the array.
2. Subtract the maximum number from each element of the array.
3. Multiply the maximum number (found in step 1) to each element of the resultant array.

After the operations are done, return the resultant array.

Example 1:

input1 = 4 (represents the number of elements in the input1 array)

input2 = {1, 5, 6, 9}

Expected Output = {-72, -36, 27, 0}

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$\{(1 - 9), (5 - 9), (6 - 9), (9 - 9)\} = \{-8, -4, -3, 0\}$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$\{(-8 \times 9), (-4 \times 9), (3 \times 9), (0 \times 9)\} = \{-72, -36, -27, 0\}$

So, the expected output is the resultant array {-72, -36, -27, 0}.

Example 2:

input1 = 5 (represents the number of elements in the input1 array)

input2 = {10, 87, 63, 42, 2}

Expected Output = {-6699, 0, -2088, -3915, -7395}

Explanation:

Step 1: The maximum number in the given array is 87.

Step 2: Subtracting the maximum number 87 from each element of the array:

$\{(10 - 87), (87 - 87), (63 - 87), (42 - 87), (2 - 87)\} = \{-77, 0, -24, -45, -85\}$

Step 3: Multiplying the maximum number 87 to each of the resultant array:

$\{(-77 \times 87), (0 \times 87), (-24 \times 87), (-45 \times 87), (-85 \times 87)\} = \{-6699, 0, -2088, -3915, -7395\}$

So, the expected output is the resultant array {-6699, 0, -2088, -3915, -7395}.

Example 3:

input1 = 2 (represents the number of elements in the input1 array)

input2 = {-9, 9}

Expected Output = {-162, 0}

Explanation:

Step 1: The maximum number in the given array is 9.

Step 2: Subtracting the maximum number 9 from each element of the array:

$\{(-9 - 9), (9 - 9)\} = \{-18, 0\}$

Step 3: Multiplying the maximum number 9 to each of the resultant array:

$\{(-18 \times 9), (0 \times 9)\} = \{-162, 0\}$

So, the expected output is the resultant array {-162, 0}.

Note: The input array will contain not more than 100 elements

**For example:**

| Input        | Result        |
|--------------|---------------|
| 4<br>1 5 6 9 | -72 -36 -27 0 |

| Input              | Result                    |
|--------------------|---------------------------|
| 5<br>10 87 63 42 2 | -6699 0 -2088 -3915 -7395 |
| 2<br>-9 9          | -162 0                    |

**Answer:** (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Arithmetic{
3 public static void main(String[]args){
4 int n,i;
5 Scanner obj=new Scanner(System.in);
6 n=obj.nextInt();
7 int a[]=new int[n];
8 for(i=0;i<n;i++){
9 a[i]=obj.nextInt();
10 }
11 int max=a[0];
12 for(i=1;i<n;i++){
13 if(a[i]>max)
14 max=a[i];
15 }
16 for(i=0;i<n;i++){
17 a[i]=a[i]-max;
18 }
19 for(i=0;i<n;i++){
20 a[i]=a[i]*max;
21 }
22 for(i=0;i<n;i++){
23 System.out.print(a[i] + " ");
24 }
25 }
26 }

```

|   | Input              | Expected                  | Got                       |   |

Passed all tests! ✓

## Question 2

Correct

Marked out of 5.00

You are provided with a set of numbers (array of numbers).

You have to generate the sum of specific numbers based on its position in the array set provided to you.

This is explained below:

Example 1:

Let us assume the encoded set of numbers given to you is:

input1:5 and input2: {1, 51, 436, 7860, 41236}

Step 1:

Starting from the 0<sup>th</sup> index of the array pick up digits as per below:

0<sup>th</sup> index – pick up the units value of the number (in this case is 1).

1<sup>st</sup> index - pick up the tens value of the number (in this case it is 5).

2<sup>nd</sup> index - pick up the hundreds value of the number (in this case it is 4).

3<sup>rd</sup> index - pick up the thousands value of the number (in this case it is 7).

4<sup>th</sup> index - pick up the ten thousands value of the number (in this case it is 4).

(Continue this for all the elements of the input array).

The array generated from Step 1 will then be – {1, 5, 4, 7, 4}.

Step 2:

Square each number present in the array generated in Step 1.

{1, 25, 16, 49, 16}

Step 3:

Calculate the sum of all elements of the array generated in Step 2 to get the final result. The result will be = 107.

Note:

- 1) While picking up a number in Step1, if you observe that the number is smaller than the required position then use 0.
- 2) In the given function, input1[] is the array of numbers and input2 represents the number of elements in input1.

Example 2:

input1: 5 and input1: {1, 5, 423, 310, 61540}

Step 1:

Generating the new array based on position, we get the below array:

{1, 0, 4, 0, 6}

In this case, the value in input1 at index 1 and 3 is less than the value required to be picked up based on position, so we use a 0.

Step 2:

{1, 0, 16, 0, 36}

Step 3:

The final result = 53.

**For example:**

| Input                    | Result |
|--------------------------|--------|
| 5<br>1 51 436 7860 41236 | 107    |
| 5<br>1 5 423 310 61540   | 53     |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class Calculation{
3 public static void main(String[] args){
4 int n,i,num,sum=0;
5 Scanner obj=new Scanner(System.in);
```

```

6 n=obj.nextInt();
7 int a[]=new int[n];
8 for(i=0;i<n;i++){
9 a[i]=obj.nextInt();
10 }
11 int b[]=new int[n];
12 for(i=0;i<n;i++){
13 num=a[i];
14 if(i==0){
15 b[i]=num%10;
16 }
17 else if(i==1){
18 b[i]=(num/10)%10;
19 }
20 else if(i==2){
21 b[i]=(num/100)%10;
22 }
23 else if(i==3){
24 b[i]=(num/1000)%10;
25 }
26 else if(i==4){
27 b[i]=(num/10000)%10;
28 }
29 else{
30 b[i]=0;
31 }
32 }
33 int square[]=new int[n];
34 for(i=0;i<n;i++){
35 square[i]=b[i]*b[i];
36 }
37 for(i=0;i<n;i++){
38 sum=sum+square[i];
39 }
40 System.out.print(sum);
41 }
42 }
43 }

```

|   | Input                    | Expected | Got |   |

## Question 3

Correct

Marked out of 5.00

Given an array of numbers, you are expected to return the sum of the longest sequence of POSITIVE numbers in the array.

If there are NO positive numbers in the array, you are expected to return -1.

In this question's scope, the number 0 should be considered as positive.

Note: If there are more than one group of elements in the array having the longest sequence of POSITIVE numbers, you are expected to return the total sum of all those POSITIVE numbers (see example 3 below).

input1 represents the number of elements in the array.

input2 represents the array of integers.

Example 1:

input1 = 16

input2 = {-12, -16, 12, 18, 18, 14, -4, -12, -13, 32, 34, -5, 66, 78, 78, -79}

Expected output = 62

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "12, 18, 18, 14", "12", "32, 34", and "66, 78, 78". The first sequence "12, 18, 18, 14" is the longest of the four as it contains 4 elements. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers =  $12 + 18 + 18 + 14 = 63$ .

Example 2:

input1 = 11

input2 = {-22, -24, 16, -1, -17, -19, -37, -25, -19, -93, -61}

Expected output = -1

Explanation:

There are NO positive numbers in the input array. Therefore, the expected output for such cases = -1.

Example 3:

input1 = 16

input2 = {-58, 32, 26, 92, -10, -4, 12, 0, 12, -2, 4, 32, -9, -7, 78, -79}

Expected output = 174

Explanation:

The input array contains four sequences of POSITIVE numbers, i.e. "32, 26, 92", "12, 0, 12", "4, 32", and "78". The first and second sequences "32, 26, 92" and "12, 0, 12" are the longest of the four as they contain 4 elements each. Therefore, the expected output = sum of the longest sequence of POSITIVE numbers =  $(32 + 26 + 92) + (12 + 0 + 12) = 174$ .

**For example:**

| Input                                                      | Result |
|------------------------------------------------------------|--------|
| 16<br>-12 -16 12 18 18 14 -4 -12 -13 32 34 -5 66 78 78 -79 | 62     |
| 11<br>-22 -24 -16 -1 -17 -19 -37 -25 -19 -93 -61           | -1     |
| 16<br>-58 32 26 92 -10 -4 12 0 12 -2 4 32 -9 -7 78 -79     | 174    |

**Answer:** (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Calculation{
3 public static void main(String[] args){
4 int n,i;
5 Scanner obj= new Scanner(System.in);
6 n=obj.nextInt();
7 int a[]=new int[n];
8 for(i=0;i<n;i++){
9 a[i]=obj.nextInt();

```

```

10 }
11 int maxsum=-1;
12 int sum=0;
13 int maxlen=0;
14 int len=0;
15 boolean foundPositive=false;
16 for(i=0;i<n;i++){
17 if(a[i]>=0){
18 sum=sum+a[i];
19 len++;
20 foundPositive=true;
21 }
22 else{
23 if(len>maxlen){
24 maxlen=len;
25 maxsum=sum;
26 }
27 else if(len==maxlen){
28 maxsum=maxsum+sum;
29 }
30 sum=0;
31 len=0;
32 }
33 }
34 if(len>maxlen){
35 maxsum=sum;
36 }
37 else if(len==maxlen){
38 maxsum=maxsum+sum;
39 }
40 if(!foundPositive){
41 System.out.println("-1");
42 }
43 else{
44 System.out.println(maxsum);
45 }
46 }
47 }

```

|   | Input                                                      | Expected | Got |   |

## Question 1

Correct

Marked out of 5.00

Write a Java program to input a number from user and print it into words using for loop. How to display number in words using loop in Java programming.

Logic to print number in words in Java programming.

**Example****Input**

1234

**Output**

One Two Three Four

Input:

16

Output:

one six

**For example:**

| Test | Input | Result      |
|------|-------|-------------|
| 1    | 45    | Four Five   |
| 2    | 13    | One Three   |
| 3    | 87    | Eight Seven |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class Number{
3 public static void main(String[]args){
4 int num;
5 Scanner obj=new Scanner(System.in);
6 num=obj.nextInt();
7 String number=Integer.toString(num);
8 for(int i=0;i<number.length();i++){
9 char digit=number.charAt(i);
10 switch(digit){
11 case '0':
12 System.out.println("Zero ");
13 break;
14 case '1':
15 System.out.print("One ");
16 break;
17 case '2':
18 System.out.print("Two ");
19 break;
20 case '3':
21 System.out.print("Three ");
22 break;
23 case '4':
24 System.out.print("Four ");
25 break;
26
27 case '5':
28 System.out.print("Five ");
29 break;
30 case '6':
31 System.out.print("Six ");
32 break;
33 case '7':
34 System.out.print("Seven ");
35 break;
36 case '8':
37 System.out.print("Eight ");
38 break;
39 case '9':
40 System.out.print("Nine ");
41 break;
42 }
```

```
43 | }
44 | }
45 |
46 | }
47 | }

## Question 2

Correct

Marked out of 5.00

Consider a sequence of the form 0, 1, 1, 2, 4, 7, 13, 24, 44, 81, 149...

Write a method program which takes as parameter an integer n and prints the nth term of the above sequence. The nth term will fit in an integer value.

Example Input:

5

Output:

4

Example Input:

8

Output:

24

Example Input:

11

Output:

149

For example:

| Input | Result |
|-------|--------|
| 5     | 4      |
| 8     | 24     |
| 11    | 149    |

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Add{
3 public static void main(String[] args){
4 int a,b,c,d,n;
5 Scanner obj=new Scanner(System.in);
6 n=obj.nextInt();
7 a=0;
8 b=1;
9 c=1;
10 d=a+b+c;
11 if(n==1){
12 System.out.println(a);
13 }
14 else if(n==2||n==3){
15 System.out.println(b);
16 }
17 for(int i=4;i<=n;i++){
18 d=a+b+c;
19 a=b;
20 b=c;
21 c=d;
22 }
23 System.out.print(d);
24 }
25 }
```

|   | Input | Expected | Got |   |
|---|-------|----------|-----|---|
| ✓ | 5     | 4        | 4   | ✓ |

|   | Input | Expected | Got |   |
|---|-------|----------|-----|---|
| ✓ | 8     | 24       | 24  | ✓ |
| ✓ | 11    | 149      | 149 | ✓ |

Passed all tests! ✓

## Question 3

Correct

Marked out of 5.00

You and your friend are movie fans and want to predict if the movie is going to be a hit!

The movie's success formula depends on 2 parameters:

the acting power of the actor (range 0 to 10)

the critic's rating of the movie (range 0 to 10)

The movie is a hit if the acting power is excellent (more than 8) or the rating is excellent (more than 8). This holds true except if either the acting power is poor (less than 2) or rating is poor (less than 2), then the movie is a flop. Otherwise the movie is average.

Write a program that takes 2 integers:

the first integer is the acting power

second integer is the critic's rating.

You have to print Yes if the movie is a hit, Maybe if the movie is average and No if the movie is flop.

Example input:

9 5

Output:

Yes

Example input:

1 9

Output:

No

Example input:

6 4

Output:

Maybe

**For example:**

| Input | Result |
|-------|--------|
| 9 5   | Yes    |
| 1 9   | No     |
| 6 4   | Maybe  |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class Prediction{
3 public static void main(String[] args){
4 int a,b,c;
5 Scanner obj=new Scanner(System.in);
6 a=obj.nextInt();
7 b=obj.nextInt();
8 if(a<2||b<2){
9 System.out.print("No");
10 }
11 else if(a>8||b>8){
12 System.out.print("Yes");
13 }
14 else if(a<2||b>8 && a>8||b<2)
15 System.out.print("No");
16 else if(a>=2||b>8 || a>8&&b>=2)
17 System.out.print("Maybe");
18 }
19 }
20 }
```

---

|   | Input | Expected | Got   |   |
|---|-------|----------|-------|---|
| ✓ | 9 5   | Yes      | Yes   | ✓ |
| ✓ | 1 9   | No       | No    | ✓ |
| ✓ | 6 4   | Maybe    | Maybe | ✓ |

Question **1**  
 Correct  
 Marked out of 5.00

Write a program to find whether the given input number is Odd.

If the given number is odd, the program should return 2 else It should return 1.

Note: The number passed to the program can either be negative. positive or zero. Zero should NOT be treated as Odd.

For example:

| Input | Result |
|-------|--------|
| 123   | 2      |
| 456   | 1      |

Answer: (penalty regime: 0 %)

```

1 import java.util.Scanner;
2 public class Number{
3 public static void main(String[]args){
4 int n;
5 Scanner obj=new Scanner(System.in);
6 n=obj.nextInt();
7 if(n%2!=0)
8 System.out.print("2");
9 else
10 System.out.print("1");
11 }
12 }
13

```

## Question 2

Correct

Marked out of 5.00

Write a program that returns the last digit of the given number. Last digit is being referred to the least significant digit i.e. the digit in the ones (units) place in the given number.

The last digit should be returned as a positive number.

For example,

if the given number is 197, the last digit is 7

if the given number is -197, the last digit is 7

**For example:**

| Input | Result |
|-------|--------|
| 197   | 7      |
| -197  | 7      |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class Digit{
3 public static void main(String[] args){
4 int n,rem;
5 Scanner obj=new Scanner(System.in);
6 n=obj.nextInt();
7 if(n!=0){
8 rem=n%10;
9 rem=Math.abs(rem);
10 System.out.print(rem);
11 }
12 }
13 }
14 }
15 }
```

|   | Input | Expected | Got |   |
|---|-------|----------|-----|---|
| ✓ | 197   | 7        | 7   | ✓ |
| ✓ | -197  | 7        | 7   | ✓ |

Passed all tests! ✓

## Question 3

Correct

Marked out of 5.00

Rohit wants to add the last digits of two given numbers.

For example,

If the given numbers are 267 and 154, the output should be 11.

Below is the explanation:

Last digit of the 267 is 7

Last digit of the 154 is 4

Sum of 7 and 4 = 11

Write a program to help Rohit achieve this for any given two numbers.

Note: Tile sign of the input numbers should be ignored.

i.e.

if the input numbers are 267 and 154, the sum of last two digits should be 11

if the input numbers are 267 and -154, the sum of last two digits should be 11

if the input numbers are -267 and 154, the sum of last two digits should be 11

if the input numbers are -267 and -154, the sum of last two digits should be 11

**For example:**

| Input        | Result |
|--------------|--------|
| 267<br>154   | 11     |
| 267<br>-154  | 11     |
| -267<br>154  | 11     |
| -267<br>-154 | 11     |

**Answer:** (penalty regime: 0 %)

```
1 import java.util.Scanner;
2 public class Add{
3 public static void main(String[] args){
4 int a,b,result;
5 int c,d;
6 Scanner obj=new Scanner(System.in);
7 a=obj.nextInt();
8 b=obj.nextInt();
9 if(a!=0){
10 c=a%10;
11 c=Math.abs(c);
12 d=b%10;
13 d=Math.abs(d);
14 result=c+d;
15 System.out.print(result);
16 }
17
18 }
19 }
20 }
```

|   | Input        | Expected | Got |   |
|---|--------------|----------|-----|---|
| ✓ | 267<br>154   | 11       | 11  | ✓ |
| ✓ | 267<br>-154  | 11       | 11  | ✓ |
| ✓ | -267<br>154  | 11       | 11  | ✓ |
| ✓ | -267<br>-154 | 11       | 11  | ✓ |

## **ABSTRACT**

The Expense Tracker Application is an automated software solution designed to facilitate effective financial management for individuals and businesses. The system aims to enhance budgeting, expense tracking, and overall financial awareness, ensuring that users can monitor their financial activities with ease and precision. The primary features of the application include maintaining a comprehensive record of expenses, categorizing spending by type (such as income, groceries, entertainment, etc.), and generating detailed reports on financial performance. Users can effortlessly add, update, or remove transactions, capturing essential details such as date, category, description, and amount spent. Additionally, the application provides a user-friendly interface for visualizing financial data through charts and graphs, enabling users to identify spending trends and make informed decisions. Budgeting tools allow users to set spending limits for various categories, helping them stay within their financial goals. Alerts and reminders can be configured to notify users of upcoming bills or budget thresholds.

# INTRODUCTION

## 1.1 INTRODUCTION

### Introduction to the Expense Tracker Application

In an increasingly complex financial landscape, managing personal finances has become more crucial than ever. The Expense Tracker Application is designed to empower individuals and small businesses by providing a comprehensive tool for monitoring and managing their financial activities. This innovative application simplifies the process of tracking expenses, budgeting, and analyzing spending habits, enabling users to gain greater control over their financial well-being.

## 1.1 IMPLEMENTATION

The **Expense Tracker** project discussed here is implemented using the concepts of **JAVA SWING** and **MYSQL**.

## 1.2 SCOPE OF THE PROJECT

The Expense Tracker application enables users to manage their personal finances by adding, updating, and categorizing transactions as income or expenses through a user-friendly Java interface. It integrates with a database for efficient data storage and retrieval, facilitating monthly expense calculations and financial summaries.

## 1.3 WEBSITE FEATURES

- Add, update, and remove transactions.
- Categorize transactions as income or expenses.
- Calculate and display monthly income and expenses.
- User-friendly graphical interface using Java Swing.
- Database integration for secure data storage and retrieval.
- Display total balance, total income, and total expenses.
- Customizable transaction descriptions.
- Confirmation dialogs for critical actions (e.g., deletion and logout).

## **SYSTEM SPECIFICATIONS**

# SNAPSHOTS

## 4.1 HOME PAGE

## 4.2 LOGIN PAGE

### 4.3 ADD TRANSACTION

## 4.4 UPDATE TRANSACTION

## 4.4 REMOVE TRANSACTION

The screenshot shows the AURA-ExpenseTracker application running in a Java IDE. The application window displays a table of transactions and a sidebar with navigation buttons. A dialog box titled 'Confirm Deletion' is open, asking 'Are you sure you want to delete this transaction?' with 'Yes' and 'No' buttons. The table shows two transactions:

| ID | Date       | Type    | Description | Amount  |
|----|------------|---------|-------------|---------|
| 8  | 2024-11-20 | Expense | Medical     | 100.00  |
| 10 | 2024-11-20 | Expense | Medical     | 1000.00 |

Below the table, the application shows the following summary:

- Total Balance: ₹-1100.00
- Total Income: ₹0.00
- Total Expense: ₹1100.00

The IDE terminal shows the following output:

```
(djangover) D:\My Apps\Build Ones\ExpenseTracker> cmd /c "C:\Users\rampr\AppData\Local\Microsoft\Windows\GlobalStorage\pleiades.java-extension-pack-jdk\java\latest\b
in\java.exe @C:\Users\rampr\AppData\Local\Temp\cp_a3zvp1r9cb324f9h1phmvd1.argfile ExpenseTracker-ExpenseAndIncomeTrackerApp "
```

## 4.5 CALCULATE MONTHLY EXPENSE

The screenshot shows the AURA-ExpenseTracker application running in a Java IDE. The application window displays a table of transactions and a sidebar with navigation buttons. A dialog box titled 'Monthly Summary' is open, showing the following summary for November 2024:

Monthly Summary

- Total Income: ₹0.00
- Total Expense: ₹2000.00
- Net Amount: ₹-2000.00

Below the table, the application shows the following summary:

- Total Balance: ₹-2000.00
- Total Income: ₹0.00
- Total Expense: ₹2000.00

The IDE terminal shows the following output:

```
Transaction inserted successfully into medical_transactions
Connected to the database
Transaction removed successfully from the main table.
Connected to the database
Transaction removed successfully from medical_transactions
Connected to the database
Main transaction updated successfully.
Transaction updated successfully in medical_transactions
```
